evaluating cystic pulmonary fibrosis by associating comparison of obtained results. The invention further comprises: a kit for carrying out the evaluating method, comprising a solid-phase component and an antibody coupled with an antigenic peptide having a sequence of ADRA7112, or a solid-phase component comprising an immobilised antibody (first antibody solid-phase component comprising an immobilised antibody (first antibody) useful for evaluating the antigenic peptide. The method or kit are useful for evaluating cystic pulmonary fibrosis in an individual, where the evaluation includes diagnosis for the presence or absence of a risk of cystic pulmonary fibrosis, evaluation of serious or acute conditions, or the evaluation of the advanced grade of the disease. The method enables simple, cost-effective, rapid, highly sensitive and highly accurate evaluation of the acute or serious conditions, or the advancement of the pulmonary diseases. This sequence represents the human advancement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CAP18 protein of the invention.

```
The invention describes a polypeptide (1) of up to 50 amino acids where the polypeptide binds specifically to a chemerink polypeptide. Also described are: a mucleic acid sequence encoding (1); an expression vector comprising the coding sequence of the nucleic acid; a transgenic animal transfected with the expression vector; a (therapeutic) composition comprising (1) and an isolated chemerink polypeptide or a nucleic acid sequence of (1); an antibody that selectively binds to (1); identifying an agent that modulates the interaction between a chemerin polypeptide and a gent that modulates the interaction between a chemerin polypeptide and a gent that modulates the interaction between a chemerink polypeptide; detecting the presence, in a sample, of an agent that modulates the interaction between a Chemerink polypeptide is detecting the presence, in a sample, of an agent that modulates the function of Chemerink polypeptide; detecting the presence, in a sample, of an agent that modulates the function of Chemerink polypeptide is disorder characterized by dysregulation of Chemerink (polypeptide) signaling, a ktt, for screening agents that modulate the signaling activity of Chemerink polypeptide of signaling, a ktt, for screening agents that chemerink polypeptide signaling, a comprising an isolated chemerink polypeptide signaling, a comprising an isolated polymuclectide encoding (1), an isolated polymuclectide encoding (1), and its packaging creamediament for exvivo gene hersapy or for in vivo gene thersapy or a medicament for exvivo gene thersapy or for in vivo gene thersapy or a medicament for an invitro method of inhibiting call proliferation, where the medicament is creating a disease, and slocked or in vivo gene thersapy or composition, composition or expression vector is useful for activation; baraproceinemias, purpura, searcidess, Sezary Syndrome, Waldenstron's Macroglobulinamia, Gaucher's placese, in stelland in virtue disease, the polypeptides and polymer population are useful for diagnosing and executing the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    61 LDPRPTMDGDPDTPKPVSFTVKETVCPRTTQQSPEDCDFKKDGLVKRCMGTVTLNQARGS 120

Novel cathelin-like prepro-FALL-39 (AAR92924) is the precursor of the antimicrobial, antibacterial agent FALL-39 (see AAR92923). It is the product of a CDNA clone (AAT1823) isolated from a human bone marrow CDNA library. FALL-39 includes a helical region (see AAR92922) that is required for biological activity. FALL-39 is useful therapeutically for inhibiting microbial growth in mammmals, including humans, and is non-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                       The invention relates to a novel polypeptide composition for preventing disease in an organism which comprises one or more types of polypeptide which have an alpha-helix structure and/or thionine component. The composition of the invention demonstrates antibacterial and antifungal activities and may be useful for preventing a disease in an organism, for generating cultivated plants and in providing resistance to plant tissue against fungi such as Pyricularia oryzae (rice blast fungus), Ceratocystis finbriata and bacteria such as Pseudomonas etc. The composition has high antimicrobial activity at low concentration. The current sequence is that of the rabbit CAP18 full-length protein of the

The invention describes new transplant compositions comprising antimicrobial polypeptides or pore forming agents and/or cell surface antimicrobial polypeptides or pore forming agents and/or cell surface receptor binding compounds. The media is capable of extending the preservation period past 72 hours and can provide organs with increased functionality upon transplant. animals receiving kidneys stored in the media of the present invention for either three or four days had serum creatinine levels of less than half of those observed in control animals receiving kidneys stored in UW solution (defined in the specification) alone. Lower serum creatinine levels are indicative of healthier kidneys alone. Lower serum creatinine levels are indicative of healthier kidneys alone. Lower serum engelul for decreasing transplant of healthier kidneys and/or treated in the media. The media may also be used in procedures and/or treated in the media. The media may also be used in procedures and/or treated in the media. The media may also be used in procedures organs leads to a decrease in chronic rejection. This sequence represents an antimicrobial peptide studied in the development of the transplant
                         Media comprising antimicrobial polypeptides or pore forming agents and/or cell surface receptor binding compounds useful for the storage and preservation of organs prior to transplant.

The invention relates to a novel method for diagnosing and analysing autoimmune disease or arthritides. The method comprises obtaining a autoimmune disease or arthritides. The method comprises obtaining a patient sample containing mRNA, analysing gene expression using that that can expression signature to diagnose or analyse the autoimmune disease or arthritides in the patient, where gene expression of at least 60% of the genes correlates with that of the gene signature. The invention of turther comprises: a treatment of theumatoid arthritis; identification of genes for targeting in the treatment of rheumatoid arthritis; dentification of array or gene chip, specific for rheumatoid arthritis; diagnosis or array or gene chip, specific for rheumatoid arthritis; accening the carray or gene chip, specific for rheumatoid arthritis; screening the carray or analyses of autoimmune disease or rheumatoid arthritis; screening the cefficacy of a candidate drug in vitro for the treatment of collagentinduced arthritis. The compositions of the invention have the following correctivities: immunosuppressive, antirheumatic, antiathritis, oscepathic, antishlammatory, dermatological, and immunomodulatory. The methods and compositions of the present invention are useful for methods and compositions of the present invention are useful for diagnosing and treating autoimmune disease or arthritides, such as theumatoid arthritis, lupus, ankylosing spondylitis, fibromyalgia, osteoarthritis, gout, juvenile rheumatoid arthritis, and sease caused by an infectious agent. This sequence reparement of immune disease or arthritides. Note: This sequence is not shown in the specification. It has been supplied in an electronic format from

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ઠે
                                                                                                                                                                                                                                                                                          The present invention describes a method for determining the susceptibility of a subject to infection. The method comprises: (i) providing a sample from a subject; (ii) detecting any cathelicidin type providing a sample from a subject; (iii) detecting any cathelicidin type comparing the sample from the sample; (iii) optionally comparing the susceptibility of the subject to infection (where no LL-37 or a low level of LL-37 indicates that subject is susceptible to infection); and (v) optionally administering an antimicrobial agent to reduce infection. Also described is a product containing LL-37 and a cytostatic drug, corticosteroid or growth factor (preferably recombinant granulocyte colony stimulating factor (GCSP) or GM-CSP). The product has antimicrobial, antiinflammatory and immunostimulant activities. The method can be used for determining the susceptibility of a subject to infection such as bacterial infection (e.g. Actinobacillus actinomycetemcomitans infection) and neutropenia, and for diagnosing controls the normal flora in the form of toothpaste or mouthwash for the preventative treatment of infection e.g. contropenia and so combat lifections. The method controls the normal flora in neutropenia and so combat lifections. The present sequence represents the proform of human LL-37, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    120

Delypeptides, and their related nucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus server as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide commands. The invention also relates to nucleic acid and polypeptide compared to the TAT nucleic acid and nucleic acids and polypeptide; expression vectors and host cells comprising a TAT nucleic acid; an antibody specific for a TAT polypeptide; desponsitions are useful acid; an antibody specific for a TAT polypeptide; fusion proteins comprising a TAT polypeptide; and methods and compositions for the treatment or diagnosis of cancer in mammals. TAT polypeptides, nucleic acids, antibodies, antagoniers, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with concers, lung cancer, colorectes such expects. Colorected cancer, lung cancer, cervical cancer, inver cancer, bladder cancer, pancreatic cancer, cervical cancer, inverse system, melanoma and leukaemia. TAT nucleic acids may further be used as hybridisation probes, in chromosome and each and present sequence chromosome identification and in gene therapy. The present sequence

keratinocyte growth factor-2 (KGP-2) (1) comprising heterologous keratinocyte growth factor-2 (KGP-2) (1) comprising providing a host cell (1) consisting of primary keratinocytes and immortalized keratinocytes and an expression vector comprising a DNA sequence encoding (1) operably comprising (11) under conditions such that (1) is expressed.

(11), and culturing (11) under conditions such that (1) is expressed.

(2) Also described are: (11) produced by the novel method; a composition comprising keratinocyte specific promoter operably linked to a DNA comprising a keratinocyte specific promoter operably linked to a DNA comprising the vector; a method for providing a kin equivalent expressing an exogenous antimicrobial polypeptide; a host cell, which comprises the vector; a method for providing a kin equivalent expressing an exogenous antimicrobial polypeptide; a composition comprises the vector; a method for providing a state expressing an exogenous antimicrobial polypeptide; a method of selecting cells with increased pluripotency or multipotency relative to a population of comprising providing a population of cells and electroporating the cells generated by the method; a population of cells generated by the method; a population of cells generated by the method; a population of cells generated by the method; a method of selecting keratinocytes with holoclone or meroclone cell morphology comprises providing a population of cells generated by the method; a method of selecting keratinocytes with comphology are selected; and a keratinocyte population generated by the method; and a keratinocyte population generated by the method; and a keratinocyte population generated by the method; and a keratinocyte population generated by the complex wounds and a vector of an expective under conditions cell morphology are selected; and a keratinocyte population generated by the conditions of cells generated by the method; and a keratinocyte population generated by the conditions cell morphology are selected; and a keratinocyte pop
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Providing cells expressing heterologous keratinocyte growth factor-2 (I), which is useful to treat wounds e.g. ulcerative colitis, comprises introducing a vector comprising a DNA that encodes (I) to a host cell and culturing the host cell.
                                                                                                                                                                                                                    vulnerary; antiulcer; antiinflammatory; gastrointestinal-gen.;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method of inhibiting the spread and/or reducing the risk of infection of a virus, involving contacting a virus with a cathelicidin functional fragment. The invention also relates to a method of treating atopic dermatitis involving contacting a subject having or suspected of having acopic dermatitis with an inhibiting effective amount of a cathelicidin functional fragment. The cathelicidin functional argument. The cathelicidin antiviral activity. The methods are useful for inhibiting the spread and/or reducing the risk of infection of a virus and for treating atopic dermatitis. This sequence represents the human cathelicidin polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Inhibiting spread and/or reducing risk of infection of virus, involves contacting virus with cathelicidin functional fragment.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a vaccine comprising at least one antigen and at least one cathelicidin derived antimicrobial peptide or its derivative. The vaccine is useful for active immunization, especially of humans or animals without protection against the specific antigen. The cathelicidin derived antimicrobial peptide is useful in the preparation of an adjuvant for enhancing the immune response to at least one antigen, where the adjuvant enhances the uptake of at least one antigen, where the presenting cells (APC), and the adjuvant is added to the vaccine. Sequences ABB07701-07 represent cathelicicidin proteins form various

                                                                                                                                                                                                                                                                                                                                                                                                                                                     A53421
antibacterial peptide precursor - pig
antibacterial peptide precursor - pig
antibacterial peptide domestica (domestic pig)
C; Species: Sus Scrofa domestica (domestic pig)
C; Date: 19-May-1994 #text_change 09-Jul-2004
C; Accession: A53421
R; Zanetti, M: Storici, P:; Tossi, A.; Scocchi, M.; Gennaro, R.
J. Biol. Chem. 269, 7855-7858, 1994
A; Title: Molecular cloning and chemical synthesis of a novel antibacterial peptide deriv
A; Reference number: A53421; MUID:94179144; PMID:8132502
A; Accession: A53421
A; Ratus: preliminary
A; Molecule type: mRNA
A; Readus: 1-153 < ZAN
A; Cossion: C; Superfamily: cathelin; cystatin homology
C; Superfamily: cathelin; cystatin homology
C; Keywords: antibacterial
F; 22-129/ Domain: cystatin homology < CYS>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         7

S55609
protegrin 5 precursor - pig
N;Alternate names: cathelin-associated antimicrobial peptide
C;Species: Sus scrofa domestica (domestic pig)
C;Dacession: S6628; Baequence_revision 03-Nov-1995 #text_change 09-Jul-2004
C;Accession: S6628; S7609

Antibacterial protein FALL-39 procusor (RALL-39 peptide antibiotic)
(Cationic antimicrobial protein CAP-18) (rhCAP-18) [Contains:
Antibacterial protein LL-37 (rhLL-37)].
Antibacterial protein RAL-37 (rhLL-37)].

"PMAP-37, a novel antibacterial peptide from pig myeloid cells. cDNA cloning, chemical synthesia and activity.";
Eur. J. Blochem. 228:941-946 (1995).
-1- FUNCTION: Exerts antimicrobial activity against both Gram-positive and negative bacteria with minimal inhibitory concentrations ranging over 1-4 micro molar. Its activity appears to be mediated by its ability to damage bacterial membranes.
-1- SIMILARITY: Belongs to the cathelicidin family.
                                                                                                                                                                                                                                               01-OCT-1996 (Rel. 34, Created)

from sheep and goat laukocytes.;
Infect. Immun. 67:4106-4111(1999).
-!- FUNCTION: Bainds to the lipid a moiety of bacterial
lipopolysaccharides (LPS), a glycolipid present in the outer
membrane of all Gram-negative bacteria. Shows a potent
antimicrobial activity against Gram-negative bacteria B.coli,
S.typhimurium and P.aeruginosa. Less active against Gram-positive
bacteria S.aureus, L.monocytogenes and B.subtilis.
-!- DOMAIN: BACS sequence consists almost exclusively of X-P-P-Y
                                                                                                                                                                                                                                                                                                                                  "Purification and properties of proline-rich antimicrobial peptides

Antibacterial peptide PMAP-36 precursor (Myeloid antibacterial peptide
                                                                                                                                                                                                                                                                                                                            MEDLINE=94123775; PubMed=8293820; DOI=10.1016/0014-5793(94)80214-9; Storici P., Scocchi M., Tosei A., Gennaro R., Zanetti M.; Storici P., Scocchi M., Tosei A., Gennaro R., Zanetti M.; Chemical synthesis and biological activity of a novel antibacterial peptide deduced from a pig myeloid cDNA."; FEBS Lett. 337:303-307(1994).

-I- FUNCTION: Exerts antimicrobial activity against both Gram-positive and negative bacteria. Its activity appears to be mediated by its ability to damage bacterial membranes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gapa

Protein Sequence Searches - February 2005

All of the sequence databases on ABSS have recently been updated.

- Please note that the curators of the UniProt database have purged some temporary accession numbers from the most recent version of UniProt. These sequences have been assigned new permanent accession numbers. The new UniProt record may not contain the previous temporary accession number.
- If you encounter an accession number from an older search run against UniProt (results file extension .rup) that can no longer be found in the database, the permanent record with the new accession number can be found by searching the old accession number in the UniProt Protein Archive database (UniPARC) at:

http://www.pir.uniprot.org/database/archive.shtml

If you have any questions regarding this information or your results, please contact any STIC searcher.

When submitting sequence search results for scanning into IFW, please include a copy of this attachment to assist any future Examiners or members of the public who may encounter UniProt temporary accession numbers.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 6, Ap

Patent No. 6103888
GENERAL INFORMATION:
APPLICANT: Larrick, James W.
APPLICANT: Hirata, Mishimasa
APPLICANT: Hirata, Mishimasa
APPLICANT: Balint, Robert F.
TITLE OF INVENTION: Lipopolysaccharide Binding and Anti-Coagulant Activity
NUMBER OF SEQUENCES: 30
CORRESCONDENCE ADDRESS:
ADDRESSER: Townsend and Townsend and Crew LLP
STREET: TWO Embarcadero Center, 8th Floor

Sequence 4, Application US/08313681A

Patent No. 5618675

GENERAL INFORMATION:
APPLICANT: Wright, James W.
APPLICANT: Wright, Suan C.
APPLICANT: Hirata, Mishimasa
TITLE OF INVENTION: Human Cationic Proteins Having
TITLE OF INVENTION: Lipopolysaccharide Binding and Anti-Coagulant Activity
NUMBER OF SEQUENCES: 30
CORRESPONDENCE ADDRESS:
ADDRESSER: Townsend and Townsend Khourie and Crew
STREET: One Market Plaza, Steuart Tower, Suite 2000
CITY: San Francisco
STATE: California

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Published_Applications Mucleic Acid and Published_Applications Amino Acid database searches now generate two sets of results each. The Published_Applications databases have been split into two parts to reduce the amount of time required for their daily updates. This results in more machine time being available for processing searches.

Newly published applications will appear in the Published_Applications_New databases: older published applications make up the Published Applications applications.

Searches run against Nucleic Acid Published_Applications produce two sets of results, with the extensions rupbm (Published_Applications_NA_New).
Searches run against Amino Acid Published_Applications produce two sets of results, with the extensions rapbm (Published_Applications_AA_New).
